Hi Obed,

I hope you're well.

I have added logic to the workflow to read an AvailableMetadataKey from the mediastore used to create the XML, this will now set a Boolean MetadataField to True upon successful XML creation.

The Metadata Field in Curator is called 'TBN_TransferredToOBTV' with a display name of 'Transferred to OBTV?'

I have added logic to the plug-in configuration to deny the plug-in becoming active is this field is set to True on the asset.

Tim provided my with access to a FCPXML which is exported from OBTV and I have logged 2 FR requests with our DEV team, one to allow the ingest of the FCPXML and generation of a Premiere Production / one to allow API requests to process the FCPXML to create a Premiere Production.

Let me know if you have any further questions.

Thanks,

Jack Hawkins

Hi Obed, Tim,

If possible please could you share one of your project exports from OBTV? I want to verify the watchfolder ingest method.

Thanks,

Jack Hawkins

Subject: Re: OBTV - Curator Plug-in

Hi Obed,

I have added user.realname to be parsed in the XML, see below:

```
<assets>
  <asset>
    <asset.asset_id>f14a2f5a-80a0-494a-b3e7-1602a5e9cec8</asset.asset_id>
    <asset.name>FC-BT26-1560</asset.name>
    <asset.folder_path>Library\TBN-FAST</asset.folder_path>
    <WebProxyPath>\\tustopd.trinity.local\ipv\Curator\TUST-PROD\Proxies\WebProxy\2026\08\16\FC-
    BT26-1560-113254</WebProxyPath>
    <user.realname>System Administrator</user.realname>
  </asset>
</assets>
```

I was thinking about getting the FCPXML/ PrProj Files back into Curator by using a Watchfolder, have OBTV export the files to a watchfolder which curator ingests and creates a Production from.

Let me know your thoughts.

Thanks,

Jack Hawkins

Yes, this is a good idea. Please proceed.

Obed, one more thing I was thinking of adding the XML is the user who initiated the transfer so you can track who's bring in the content.

Let me know if you'd like to proceed.

Thanks,

Jack Hawkins

Subject: OBTV - Curator Plug-in

Hi Both,

I have created the plug-in for sending the XML to OBTV from Curator, it is called 'SendToOBTV' and looks like the following in ClipLink:

At present this plug-in is only configured for the System Administrator Workgroup.

I have built a custom transform so the XML outputted looks like the following:

```
<assets>
<asset>
<asset.name>PRS_20260504_KSHACKELFORD_CAM 7</asset.name>
<asset.asset_id>a0d4d921-708e-4f04-b0f7-7cce5371f14d</asset.asset_id>
<WebProxyPath>\\tustopd.trinity.local\IPV\Curator\TUST-
PROD\Proxies\WebProxy\2026\05\04\PRS_20260504_KSHACKELFORD_CAM-7-133850</WebProxyPath>
<asset.folder_path>Post
Production\Series\Praise\2026\PRS_20260504_PLEX_CROUCH_SHACKELFORD\STUDIO BACKUP</
asset.folder_path>
</asset>
</assets>
```

If you need any adjustments let me know but it matches the samples Tim shared on Friday.

All XML's are outputted to the following location on the OpenDrive: <\\tustopd.trinity.local\ipv\Curator\TUST-PROD\ObdAI> (2 examples have already been sent)

Many Thanks,

Jack Hawkins
